Assignment Project Exam Help Caches Part II

https://powcoder.com

Add WeChat powcoder

Review

- We would like to have the capacity of disk at the speed of the processor: unfortunately this is not feasible
- So we create a memory filer archy: Exam Help
 - each successively lowhetples/epowntales.comost used" data from next lower level
 - exploits <u>temporal locality</u>

 Add WeChat powcoder
 - do the common case fast, worry less about the exceptions (design principle of MIPS)
- Locality of reference is a Big Idea

Big Idea Review

- Mechanism for transparent movement of data among levels of a storage hierarchy
 - set of address/value pindingsExam Help
 address provides index to *set* of candidates

 - service hit or miss
 load new block and binding on miss

address: offset tag 00000000000000000 000000001

Index	Valid	Tag	0x0 - 0x3	0x4 - 0x7	0x8 - 0xb	0xc - 0xf
0						
→ 1	1	0	а	b	С	d
2						
3						

Outline

- Block Size Tradeoff
- Types of Cache Misses Assignment Project Exam Help
- Fully Associative Cache https://powcoder.com
- N-Way Associative Cache Add WeChat powcoder
- Block Replacement Policy
- Multilevel Caches (if time)
- Cache write policy (if time)

Block Size Tradeoff (1/3)

- Benefits of Larger Block Size
 - Spatial Locality: if we access a given word, we're likely to access other nearby words soon (Another Big Idea)
 - Very applicable with https://pwgodarcomept: if we execute a given instruction, it's likely that we'll execute the next few as well
 - Works nicely in sequential array accesses too

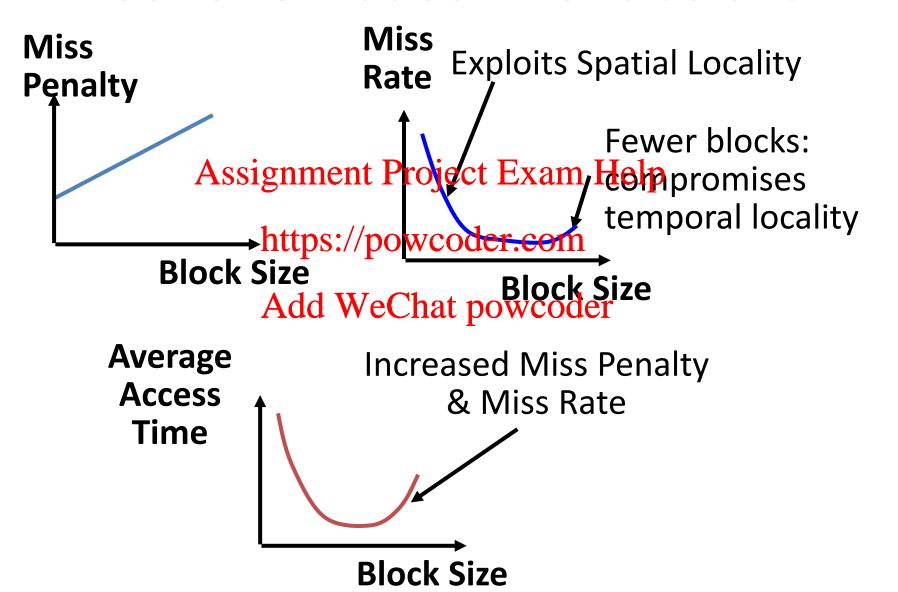

Block Size Tradeoff (2/3)

- Drawbacks of Larger Block Size
 - Larger block size means larger miss penalty
 Assignment Project Exam Help
 on a miss, takes longer time to load a new block from next level
 - If block size is too bighterstive week with the size is too bighterstive week with the size is too bighterstive week with the size is too bighterstive with the size is too bi blocks Add WeChat powcoder
 - Result: miss rate goes up
- In general, minimize
 - **Average Access Time**
 - = Hit Time + Miss Penalty x Miss Rate

Block Size Tradeoff (3/3)

- <u>Hit Time</u> = time to find and retrieve data from current level cache
- Miss Penalty = average time to retrieve data on a current level miss (includes the possibility of misses on successive levels of memory hierarchy) Add WeChat powcoder
- Hit Rate = % of requests that are found in current level cache
- Miss Rate = 1 Hit Rate

Block Size Tradeoff Conclusions

Types of Cache Misses (1/2)

- Compulsory Misses

 - occur when a program is first started
 Assignment Project Exam Help

 cache does not contain any of that program's data yet, so misses are https://powcoder.com bound to occur
 - can't be avoided easily to work the se in this course

Types of Cache Misses (2/2)

Conflict Misses

- miss that occurs because two distinct memory addresses map to the same cache location
- two blocks (which happen to map to the same location) can keep overwriting each other we Chat powcoder
- big problem in direct-mapped caches
- how do we lessen the effect of these?

Dealing with Conflict Misses

- Solution 1: Make the cache size bigger

 relatively expensive
 Assignment Project Exam Help
 Solution 2: Multiple distinct blocks can fit in the same Cache https://powcoder.com Index?

Add WeChat powcoder

Fully Associative Cache (1/3)

- Memory address fields:
 - Tag: same as before

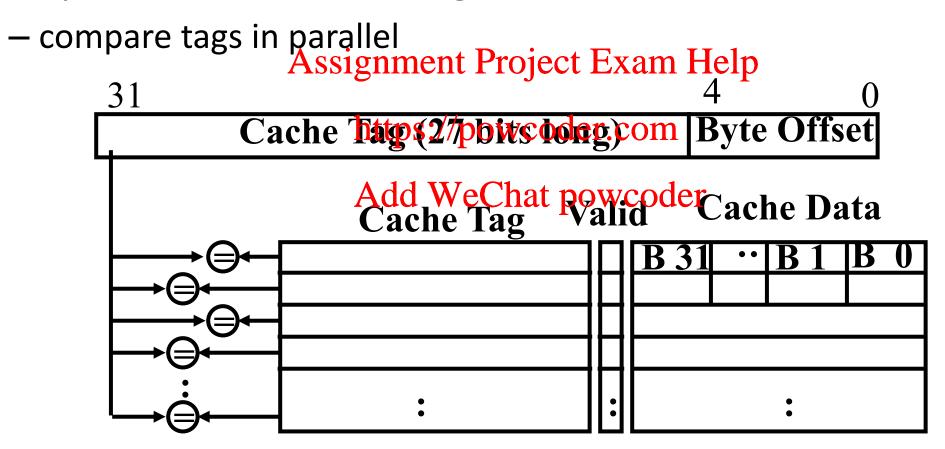

Assignment Project Exam Help

- Offset: same as before

- Index: non-existent https://powcoder.com
- What does this mean MeChat powcoder
 - any block can go anywhere in the cache
 - must compare with all tags in entire cache to see if data is there

Fully Associative Cache (2/3)

Fully Associative Cache (e.g., 32 B block)

Fully Associative Cache (3/3)

- Benefit of Fully Assoc Cache
 - No Conflict Misses (since data can go anywhere)
 Assignment Project Exam Help
- Drawbacks of Fully Assoc Cache
 - https://powcoder.com
 Need hardware comparator for every single entry:
 - If we have a 64KB of chedin washewith 48 comparators: very expensive
- Small fully associative cache may be feasible

Third Type of Cache Miss

- Capacity Misses
 - miss that occurs because the cache has a limited size
 Assignment Project Exam Help
 miss that would not occur if we increase the size of the cache

 - sketchy definition, so just get the general idea
- This is the primary type of Associate caches.

N-Way Set Associative Cache (1/4)

- Memory address fields:
 - Tag: same as before
 - Assignment Project Exam Help

 Offset: same as before

 - Index: points us to the correct row (called a set in this case)
- So what's the difference? We Chat powcoder
 - each set contains multiple blocks
 - once we've found correct set, must compare with all tags in that set to find our data

N-Way Set Associative Cache (2/4)

Summary:

- cache is direct-mapped with respect to sets
 Assignment Project Exam Help
 each set is fully associative
- If we have T blocks total, then we basically have an T/N directmapped cache, where at exclusive Nindex we find a fully associative N block cache. Each has its own valid bit and data.

N-Way Set Associative Cache (3/4)

- Given memory address:
 - Find correct set using Index value.
 Assignment Project Exam Help
 Compare Tag with all Tag values in the determined set.

 - If a match occurs, it's a hit, otherwise a miss.
 - Finally, use the offset Aidd We Chat proving the desired data within the desired block.

N-Way Set Associative Cache (4/4)

- What's so great about this?
 - even a 2-way set associative cache avoids a lot of conflict misses
 Assignment Project Exam Help
 hardware cost isn't that bad: only need N comparators
- In fact, for a cache with M blocks.
 - it's Direct-Mapped if Add Waybet 188800 fee (1 block per set)
 - it's Fully Associative if it's M-way set associative (M blocks per set)
 - so these two are just special cases of the more general set associative design

Block Replacement Policy (1/2)

- N-Way Set Assoc (N > 1): index specifies a set, but block can occupy any position within the set on a miss
- Fully Associative: block can be written fit o any position (there is no index)
- Question: if we have the choice, where should we write an incoming block?

Block Replacement Policy (2/2)

- Solution!
- If there are any locations with valid bit off (empty), then usually write the heighbook Photogham Loke.
- If all possible locations of padychavecarralid block, we must use a replacement policy by which we determine which block gets "cached out" on a miss. We Chat powcoder

Block Replacement Policy: LRU

- LRU (Least Recently Used)
 - Idea: cache out block which has been accessed (read or write) least recently

 Assignment Project Exam Help
 - Pro: temporal locality temporal locality few padeusemplies likely future use: in fact, this is a very effective policy powcoder
 - Con: with 2-way set assoc, easy to keep track (one LRU bit); with 4-way or greater, requires complicated hardware and much time to keep track of this

Block Replacement Example

• We have a 2-way set associative cache with a four word total capacity and one word blocks. We perform the following word accesses (ignore bytes for this problem):

0, 2, 0, 1, 4, 0, 2, https://powcoder.com

How many hits and how Many hisses will there for the LRU block replacement policy?

Block Replacement Example: LRU

- Addresses 0, 2, 0, 1, 4, 0, ...
 - 0: miss, bring into set 0 (loc 0)

0 remainder 2 is 0, so set 0

2: miss, bring into set 0 (loc 1)

2 remainder 2 is ⁰Assignment Project Exam Help

https://powcoder.com

1: miss, bring into set 1 (Pocyo) oder

1 remainder 2 is 1, so set 1

4: miss, bring into set 0 (loc 1, replace 2)

4 remainder 2 is 0, so set 0

0: <u>hit</u>

loc 0 loc 1

Ways to reduce miss rate

- Larger cache
 - limited by cost and technology
 - hit time of first lever signmenty Project Exam Help
- More places in the cache to put each block of memory associativity Add WeChat powcoder
 - fully-associative
 - any block any line
 - k-way set associated
 - k places for each block
 - direct map: k=1

Big Idea

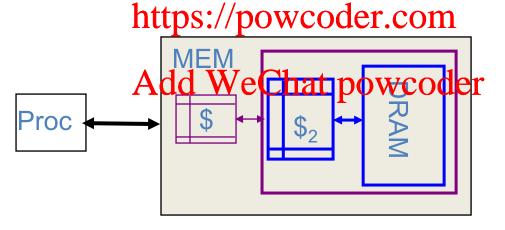

- How do we chose between options of associativity, block size, replacement policy?
- Design against a performance model
 - Minimize: Average Actes: The wooder.com
 - = Hit Time + Miss Panaltwx Miss Rate powcoder influenced by technology and program behavior

Example

- Assume
 - Hit Time = 1 cycle Assignment Project Exam Help
 - Miss rate = 5%
 - Miss penalty = 20 cycles //powcoder.com
- Average memory access the chat power of x 20 = 2 cycle

Improving Miss Penalty

- When caches first became popular,
 Miss Penalty ~ 10 processor clock cycles
- Today: 1000 MHz Processor (1 ns per clock cycle) Aggregations togeto Example 100 processor clock cycles!

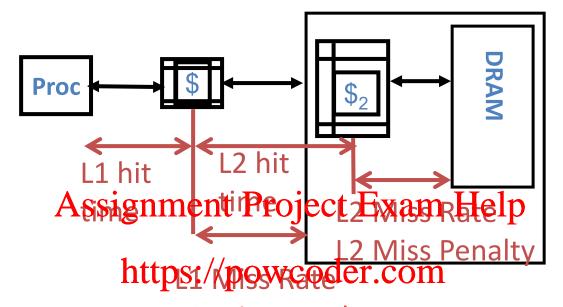

Solution: another cache between memory and the

processor cache: Second Level (L2) Cache

Analyzing Multi-level cache hierarchy

Add WeChat powcoder

Avg Mem Access Time = L1 Hit Time + L1 Miss Rate * L1 Miss Penalty

L1 Miss Penalty = L2 Hit Time + L2 Miss Rate * L2 Miss Penalty

Avg Mem Access Time = L1 Hit Time +
L1 Miss Rate * (L2 Hit Time + L2 Miss Rate * L2 Miss Penalty)

Typical Scale

```
L1
```

size: tens of KB

- hit time: complete in spieghard project Exam Help

miss rates: 1-5%

https://powcoder.com

size: hundreds of KB Add WeChat powcoder

hit time: few clock cycles

– miss rates: 10-20%

L2 miss rate is fraction of L1 misses that also miss in L2

– why so high?

Example: without L2 cache

- Assume
 - L1 Hit Time = 1 cycle Assignment Project Exam Help
 - -L1 Miss rate = 5%
 - L1 Miss Penalty = 100 cycles powcoder.com
- Average memory access the hat povology 100 = 6 cycles

Example with L2 cache

- Assume
 - L1 Hit Time = 1 cycle
 - L1 Miss rate = 5% Assignment Project Exam Help
 - L2 Hit Time = 5 cycles https://powcoder.com
 - L2 Miss rate = 15% (% L1 misses that miss)
 - − L2 Miss Penalty = 100 Adds WeChat powcoder
- L1 miss penalty = 5 + 0.15 * 100 = 20
- Average memory access time = 1 + 0.05 x 20
 = 2 cycle

3x faster with L2 cache

What to do on a write hit?

- Write-through
 - update the word in cache block and corresponding word in memory Assignment Project Exam Help
- Write-back
 - update word in cachetteck/powcoder.com

 - allow memory word to be "stale"
 add WeChat powcoder
 add 'dirty' bit to each line indicating that memory needs to be updated when block is replaced
 - OS flushes cache before I/O !!!
- Performance trade-offs?

"And in conclusion..." (1/2)

- Caches are NOT mandatory:
 - Processor performs arithmetic
 - Memory stores data
 Assignment Project Exam Help
 - Caches simply make dattersample wood fasterm
- Each level of memory hierarchyristipsty subset of next higher level
- Caches speed up due to temporal locality: store data used recently
- Block size > 1 word speeds up due to spatial locality: store words adjacent to the ones used recently

"And in conclusion..." (2/2)

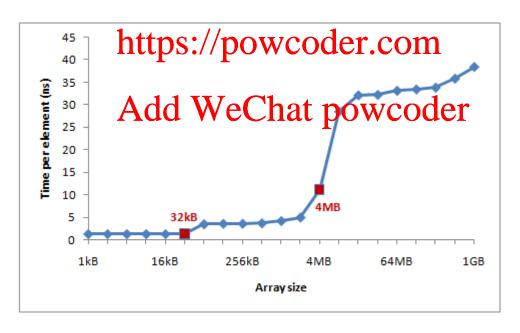

- Cache design choices:
 - size of cache: speed v. capacity
 - direct-mapped v. Assignment Project Exam Help
 - for N-way set assoc: thoise/ptwcoder.com
 - block replacement policy WeChat powcoder
 - 2nd level cache?
 - Write through v. write back?
- Use performance model to pick between choices, depending on programs, technology, budget, ...

A real example

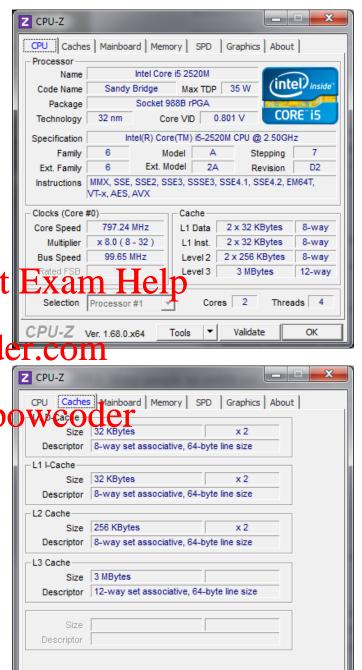

And additional reading (for fun):

http://igoro.com/archive/gallery-of-processor-cache-effects/

Assignment Project Exam Help

```
package comp273;
/** Let us observe the effect of the cache */
public class CacheTest1 {
   public static void main( String[] args ) {
       int[] A = new int[128 * 1024 * 1024];
       double total;
       int N = 8;
                  // average together 8 samples
      // Loop 1
      total = 0;
       for ( int j = 0; j < N; j++ ) {
          double start = System.nanoTime();
          for (int i = 0; i < A.length; i++) A[i] *= 3;</pre>
          double stop = System.nanoTime();
          double elapsed = stop - start;
          total += elapsed;
      Assignment Project
       System.out.println( "average time loop 1 = " + loop1Time );
      // Loop 2
                                   https://powcoder.c
      total = 0;
       for ( int j = 0; j < N; j++ ) {
          double start = System.nanoTime();
         for (int i = 0; i < A.length; At-dd A[WeChat powered 32 KByte
          double stop = System.nanoTime();
          double elapsed = stop - start;
          total += elapsed;
       double loop2Time = total / N;
       System.out.println( "average time loop 2 = " + loop2Time );
       System.out.println( "ratio is " + loop1Time / loop2Time +
              " but first loop does 32 times more work!!" );
average time loop 1 = 126858657.625
average time loop 2 = 71715726.125
ratio is 1.7689098957721807
but first loop does 32 times more work!!
    Loop 1 gets work done 18 times faster!
```
